## 1. Teach statistical thinking.

- a. **Teach statistics as an investigative process of problem-solving and decision-making.** Students should not leave their introductory statistics course with the mistaken impression that statistics consists of an unrelated collection of formulas and methods. Rather, students should understand that statistics is a problem-solving and decision-making *process* that is fundamental to scientific inquiry and essential for making sound decisions.
- b. **Give students experience with multivariable thinking.** We live in a complex world in which the answer to a question often depends on many factors. Students will encounter such situations within their own fields of study and everyday lives. We must prepare our students to answer challenging questions that require them to investigate and explore relationships among many variables. Doing so will help them to appreciate the value of statistical thinking and methods.

2. Focus on conceptual understanding.
3. Integrate real data with a context and a purpose.
4. Foster active learning.
5. Use technology to explore concepts and analyze data.
6. Use assessments to improve and evaluate student learning.

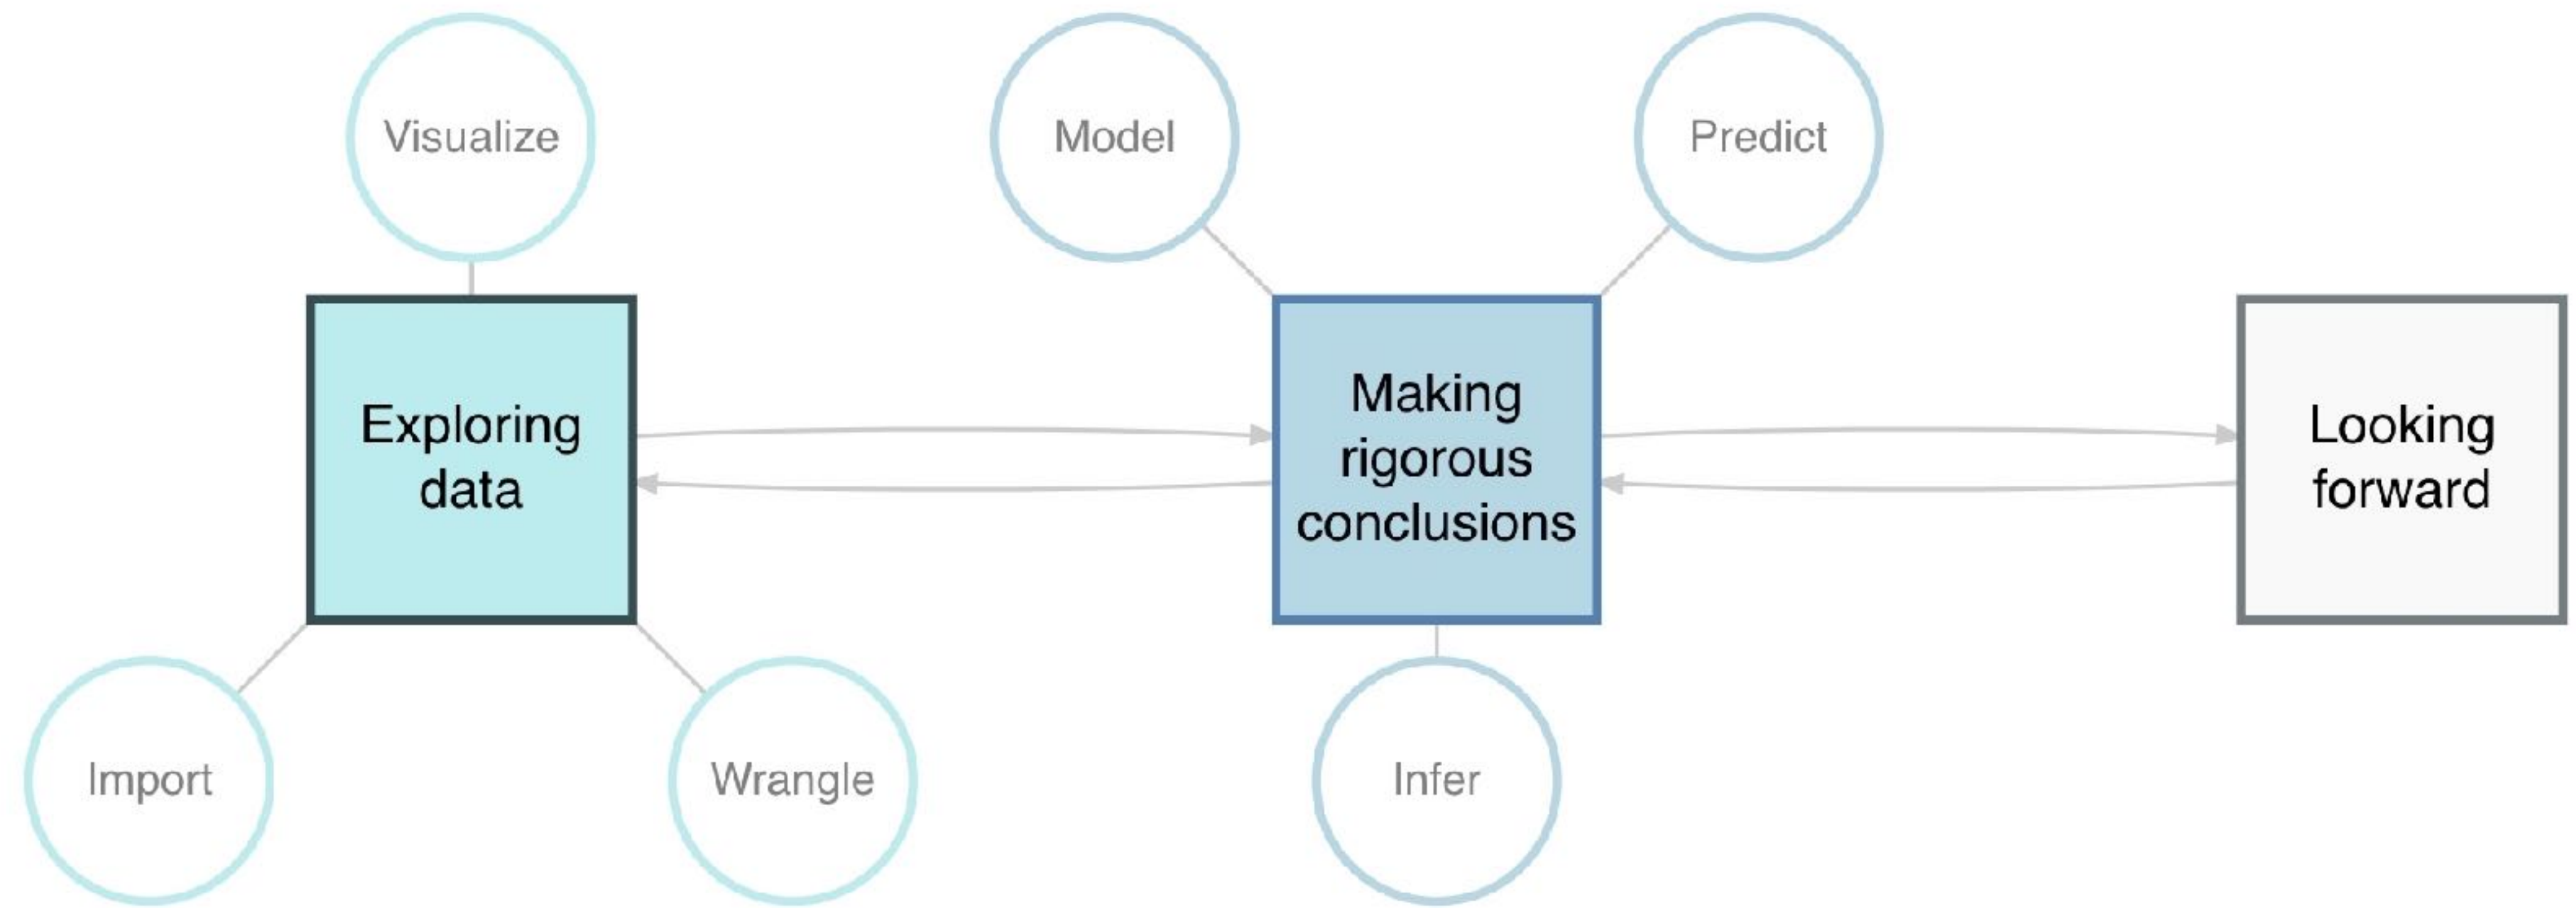

① NOT a commonly used subset of tests and intervals and produce them with hand calculations

② Multivariate analysis requires the use of computing

③ NOT use technology that is only applicable in the intro course or that doesn't follow good science principles

④ Not just inference & modeling, also data importing, cleaning, preparation, exploration, & visualization

Fundamentals of  
data & data viz,

## UN Votes

Mine Çetinkaya-Rundel  
2018-09-28

Let's take a look at the voting history of countries in the United Nations General Assembly. We will be using data from the **unvotes** package. Additionally, we will make use of the **tidyverse** and **lubridate** packages for the analysis, and the **DT** package for interactive display of tabular output.

### Data

The **unvotes** package provides three datasets we can work with: **un\_roll\_calls**, **un\_roll\_call\_issues**, and **un\_votes**. Each of these datasets contains a variable called **rcid**, the roll call id, which can be used as a unique identifier to join them with each other.

- The **un\_votes** dataset provides information on the voting history of the United Nations General Assembly. It contains one row for each country-vote pair.

un\_votes

```
## # A tibble: 738,764 x 4

# > Your turn!

- Go to [rstd.io/teach-ds-cloud](https://rstd.io/teach-ds-cloud) to join the RStudio Cloud workspace for this workshop.
- Start the assignment called **01 - UN Votes**.
- Open the R Markdown document called `unvotes.Rmd`, knit the document, view the result.
- Then, change "Turkey" to another country, and knit again.

The image shows a stack of RStudio Cloud browser windows. The top window displays the 'UN Votes' assignment page. The page has a navigation menu on the left with 'Analysis' selected. The main content area shows the title 'UN Votes' by Mine Çetinkaya-Rundel, dated 2019-07-28. Below the title is the 'Analysis' section, which includes an introduction to the `unvotes` package and the `tidyverse`, `lubridate`, and `DT` packages. It also lists three datasets: `un_roll_calls`, `un_roll_call_issues`, and `un_votes`. The page concludes with a plan to create a visualization comparing the voting record of the United States and Turkey.

**UN Votes**  
Mine Çetinkaya-Rundel  
2019-07-28

### Analysis

Let's take a look at the voting history of countries in the United Nations General Assembly. We will be using data from the `unvotes` package. Additionally, we will make use of the `tidyverse` and `lubridate` packages for the analysis, and the `DT` package for interactive display of tabular output.

```
library(tidyverse)
library(unvotes)
library(lubridate)
library(DT)
```

The `unvotes` package provides three datasets we can work with: `un_roll_calls`, `un_roll_call_issues`, and `un_votes`. Each of these datasets contains a variable called `rcid`, the roll call id, which can be used as a unique identifier to join them with each other.

- The `un_votes` dataset provides information on the voting history of the United Nations General Assembly. It contains one row for each country-vote pair.
- The `un_roll_calls` dataset contains information on each roll call vote of the United Nations General Assembly.
- The `un_roll_call_issues` dataset contains (topic) classifications of roll call votes of the United Nations General Assembly. Many votes had no topic, and some have more than one.

Let's create a visualization that we create a visualization that displays how the voting record of the United States changed over time on a variety of issues, and compares it to another country. The other country we'll display is Turkey.

```
un_votes %>%
  filter(country %in% c("United States of America", "Turkey")) %>%
  inner_join(un_roll_calls, by = "rcid") %>%
  inner_join(un_roll_call_issues, by = "rcid") %>%
  mutate(issue = ifelse(issue == "Nuclear weapons and nuclear material",
                        "Nuclear weapons and materials", issue)) %>%
  group_by(country, year = year(date), issue) %>%
```

# Q

How do you prefer your cake recipes? Words only, or words & pictures?

## Ingredients

### For the Cake:

16 ounces plain or **toasted sugar** (about 2 1/4 cups; 455g)

4 1/2 teaspoons baking powder

2 teaspoons (8g) Diamond Crystal kosher salt; for table salt, use about half as much by volume or the same weight

8 ounces unsalted butter (16 tablespoons; 225g), soft but cool, about 60°F (16°C)

3 large eggs, brought to about 65°F (18°C)

1/2 ounce vanilla extract (about 1 tablespoon; 15g)

16 ounces whole milk (about 2 cups; 455g), brought to about 65°F (18°C)

16 ounces all-purpose flour (about 3 1/2 cups, spooned; 455g)

## Directions

1. **For the Cake:** Adjust oven rack to lower-middle position and preheat to 350°F (180°C). Lightly grease three 8-inch anodized aluminum cake pans and line with parchment (explanation and tutorial [here](#)). If you don't have three pans, it's okay to bake the cakes in stages, the batter will keep at room temperature until needed.
2. In the bowl of a stand mixer fitted with the paddle attachment, combine sugar, baking powder, salt, and butter. Mix on low speed to roughly incorporate, then increase to medium and beat until fluffy and light, about 5 minutes. About halfway through, pause to scrape the bowl and beater with a flexible spatula.
3. With the mixer still running, add the eggs one at a time, letting each fully incorporate before adding the next, then dribble in the vanilla. Reduce speed to low and sprinkle in about 1/3 of the flour, then drizzle in 1/3 of the milk. Repeat with remaining flour and milk, working in thirds as before.
4. Scrape the bowl and beater with a flexible spatula, and resume mixing on medium speed for about 3 seconds to ensure everything is well combined. The batter should look creamy and thick, registering between 65 and 68°F (18 and 20°C) on a digital thermometer. (Significant

## Scatterplots

How can we visualize the relationship between characters' heights and masses? Following the structure of the `ggplot` function that we laid out earlier, we pass `starwars` to the `data` argument, and map `height` and `mass` to the `x` and `y` `aes` thetics, respectively. Then, we specify on the next layer that we would like the data points to be represented by points with `geom_point`.

Fill in the blanks below to create the scatterplot.

Code

Data Science in a Box > Hello #dsbox > Topics

✎

# Topics

The course content is organized in three units:

**Unit 1 - Exploring data:** This unit focuses on data visualization and data wrangling. Specifically we cover fundamentals of data and data visualization, confounding variables, and Simpson's paradox as well as the concept of tidy data, data import, data cleaning, and data curation. We end the unit with web scraping and introduce the idea of iteration in preparation for the next unit. Also in this unit students are introduced to the toolkit: R, RStudio, R Markdown, Git, GitHub, etc.

**Unit 2 - Making rigorous conclusions:** In this part we introduce modeling and statistical inference for making data based conclusions. We discuss building, interpreting, and selecting models, visualizing interaction effects, and prediction and model validity. Statistical inference is introduced from a simulation based perspective, and the Central Limit Theorem is discussed very briefly to lay the foundation for future coursework in statistics.

**Unit 3 - Looking forward:** In the last unit we present a series of modules such as interactive reporting and visualization with Shiny, text analysis, and Bayesian inference. These are independent modules that instructors can choose to include in their introductory data science curriculum depending on how much time they have left in the semester.

**Retrospective study** of 205 open ended student projects

- on **creativity, depth** and the complexity of **multivariate visualizations**
- compared across students who learned R using **base R** syntax vs. **tidyverse**

validated

1. Formative assessments
2. Automated grading
3. Calibrated peer review

# > Your turn!

**Think - pair - share:** What are your first reactions to the curriculum design principles you have heard so far? What aspects of it seem natural to adopt and what aspects not so much?

Let them eat cake (first)!\*

\* You can tell them  
all about the  
ingredients later!
